I honestly wasn't sure what I was going to get into when I started reading this book series. Opening up the book to a half way point just revealed math formulas and a topic that apparently had been being talked about for the last twenty (20) or so pages. I was pretty convinced at this point that it wasn't going to be a light read. I figured I would post my notes and ideas about the book and the topics covered as to share it with others that undergo the journey.

Link to the book series:

Have you gotten any further in the book? Just wondering since I'm very interested in reading this series some day.
